

PROTECT OUR COMMUNITY:

Measles Awareness and Prevention

Measles is a highly contagious virus that can spread rapidly through communities.

Vaccination is the **ONLY** way to prevent it.

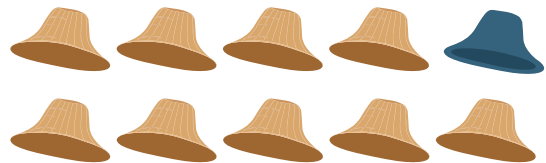

Why Vaccination Matters:

- Vaccination is the most effective way to protect yourself and others from measles.
- Regular hand washing can help reduce the spread of the virus.
- Wearing masks can provide additional protection, especially in crowded or high-risk areas.

Understanding Immunity: Immunity means having protection against a disease. For measles, this is typically achieved through vaccination. When enough people are immune, it helps protect those who cannot be vaccinated.

Who is Most at Risk?

- Unvaccinated individuals
- Babies under 12 months old
- Pregnant women
- Immunocompromised individuals
- Healthcare workers

Up to **9** in **10** people who lack immunity to measles and are close to an infected person will become infected

Protect yourself. Protect others. **Get vaccinated today!**
